

# SMART CARD READER

As threats become more sophisticated, developing strong authentication is a primary concern for all organizations, from government agencies to global corporations to financial and medical institutions. The credential reader portfolio from FEITIAN provides multiple layers of security for the most sensitive data, preventing unauthorized access to critical systems and protecting trusted identities.

FEITIAN supports high-frequency cards, contact or contactless cards, and even mobile credentials, which improves compliance and increases intelligence about who, when, and where content is accessed. After all, access to computers and logical data, such as specific servers and cloud applications, must be restricted to trusted identities, which must be simple to use.
